

5G

Evolution to the next frontier

5G Construction & Commissioning Techniques (Optical)

Upon completing the RF site build, each mobile site must be integrated into the core network. This requires connecting the site via a fibre optic circuit.

This module covers the techniques and procedures needed to connect each site to the network using optical fibre.

Learners will be exposed to techniques for splicing, fibre

identification on an active network as well as commissioning techniques for optical infrastructure.

Learners will build typical optical joint enclosures used within the network and learn introductory fault finding techniques.
